The boiler system pictured includes two Fulton ICS 20 HP low pressure steam boilers, a VTL-50 feed water system, a F-20 blowdown separator, chemical feed system and water softener completely skid mounted and prepped at the factory. This system is to prevent freezing of a water storage tank located in upstate New York.

To accommodate the extremely cold temperatures in the St. Lawrence area, the heater panel boxes, the return system panel box and all the motors include auxiliary heaters that eliminate condensation thus preventing freezing and failure of the controls and motors.
