

Fulton's Humidification Control Makes the News

Fulton teamed up with one of our reps to design and build a clean steam boiler system for a prominent New York newspaper.

The boiler system consisting of three 80 hp Vertical Multi-Port boilers, a return system, automatic blow down and water treatment equipment. These boilers will provide critical humidification control for the printing operation building. Fulton's ability to skid mount the entire boiler system and provide sectional construction allowed for an easy installation in a very difficult location.

In addition, Fulton provided a water treatment scheme with design considerations which allow this system to operate without the addition of water treatment chemicals. Fulton also offered a 10 year pressure vessel warranty, exceeding any other in the industry.
